Experiment 1: Comparative Study of Low-Code Development :

Aim: Study low-code development and compare it with traditional programming.

Explanation:

Comparison Feature Zoho Creator Microsoft Power Apps Google AppSheet Mendix Development Low-Code Low-Code No-Code/Low-Code Low-Code Database Built-in Dataverse Integrated data sources Built-in Automation Deluge Power Automate AppSheet Automation Workflow AI Support Zia Copilot Gemini AI-assisted API Integration Supported Supported Supported Supported Best suited for Business applications Microsoft ecosystem Simple business apps Enterprise applications

Advantages of Low-Code :

- Faster application development
- Less programming effort
- Easy integration with databases and APIs
- Rapid prototyping • Easier application maintenance
- Suitable for business process automation

Difference:

Low-code development	Traditional development
Visual drag-and-drop interface	More manual coding
Faster for standard business apps	More control over custom logic
Built-in forms and reports	Often requires custom UI and backend
Platform-dependent features	Greater flexibility, depending on the stack

Conclusion

Low-Code platforms simplify application development by reducing the amount of manual programming required. Zoho Creator is particularly useful for developing database-driven business applications with forms, reports, workflows, and integrations.
